

Power Distribution

PDU for Cisco 6500

Server Technology Remote Power Management for Cisco Catalyst 6500 Switches Equipped With 6000-Watt Power Supplies.

This application note provides an overview on how to power Cisco Catalyst 6500 series switches while providing redundancy in the event one power input feed is lost or if a Cisco Catalyst 6500 Series chassis supports up to two load-sharing, fault-tolerant, hot-swappable power supplies. Only one power supply is required to operate a fully loaded chassis; however, if a second power supply is installed, the load is shared across both supplies. These supplies are hot-swappable so they may be removed for servicing without down the system.
